

Introducing our new Bowling Ball Revivor

One of the most successful items in our line of Personal Products hasn't been available for a while. We didn't abandon you - we just took a timeout to rethink, redesign and make it better!

Our new design is a one-piece unit with a door that opens to the front and tightly closes to keep all the generated warm air inside the unit to work its magic. Absorbed lane oil is pulled to the surface where it can be easily wiped away.

The possibility to overheat the ball has been eliminated by building in two new and very important features. The temperature is preset to only operate at temperatures that we know to be safe for bowling ball cover-stocks and the timer is restricted to no more than two hours of continuous operation. When the time you set expires, the unit turns itself off.

One hour is all that is needed to bring a ball back to very near its "out-of-the-box" performance. But for those of you who believe that "bigger is better," you can push it out to two hours with no risk to the ball.

Innovative Bowling Products has been manufacturing Revivors for more than 20 years. Literally, hundreds of thousands of balls have been restored without any harm to the ball. We know that the temperature produced by this unit, for periods of up to two hours is not harmful to bowling ball cover-stocks.

We continue to lead the field in producing the best lines of bowling ball maintenance products.

Your game needs one of these!
